1. First download the following zip file from Google drive (it is around 250MB, a separate compiler for C, C++)

    https://drive.google.com/drive/folders/1mfG4K2USUsIdm-vJfHSe38VwYL5iR7yH?usp=sharing

2. Now move this file in C directory and extract the file in C directory (may require administrative privileges). You should see the following folders in extracted folder (C:/MinGW)

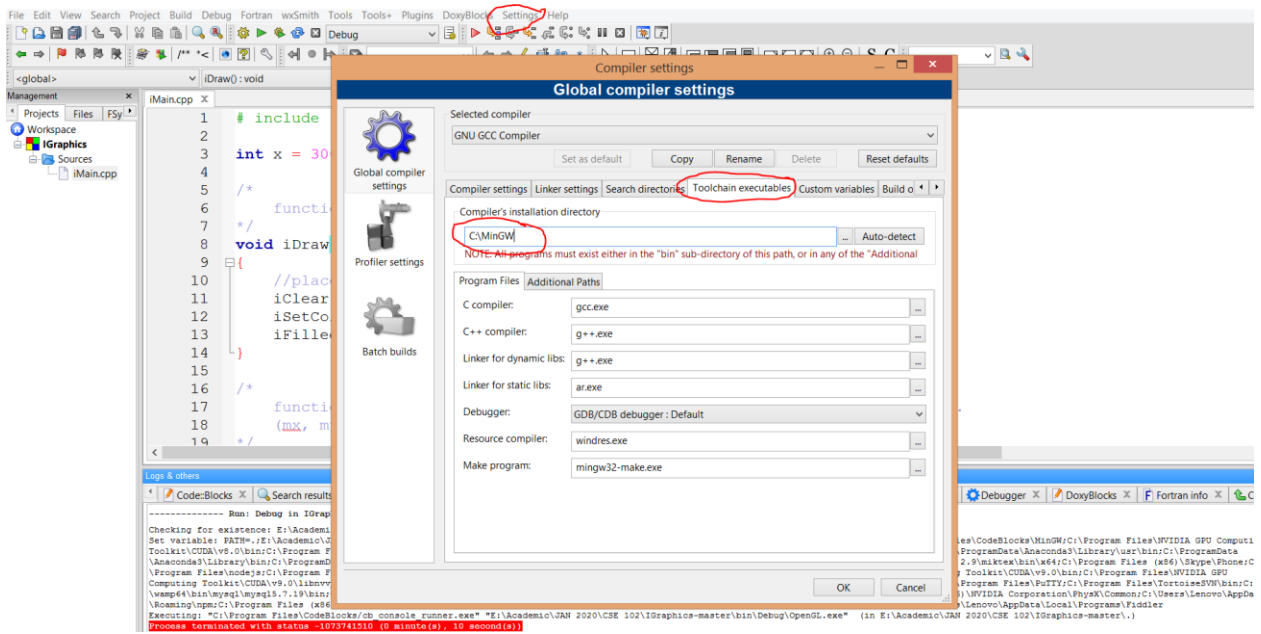

3. Open Codeblocks. Click Setting>Compiler and Click Toolchain executables tab as follows.

4. Write C:/MinGW in the Compiler's installation directory. Leave other options as it is. Click OK.

    If inside your extracted MinGW folder, you see another MinGW folder, then the path should be C:\MinGW\MinGW.

5. Now try building the project as demonstrated in the class.
